

- Changed Graph ADT to that of a directed graph implemented through an adjacency list. Only member field is now a map of Nodes (String) associated with the set of edges for which they are source nodes (Set<Edge>)
  - Methods adapted for new ADT
- Changed Edge class, so now an Edge object only contains a receiver and label member variable. Source node is contained as the associated key in map/adjacency-list of the Graph object
- Commented out unused methods in Graph that were already tested through GraphWrapper in Stage 1, as well as all of GraphWrapperTest.java and GraphWrapper.java, for the sake of coverage.
